EDUCATION

Red River College | Winnipeg, MB, Canada

Graduated September 2024

Post-secondary *Diploma* in Software Development

Certifications: Salesforce Platform Admin, Salesforce Agentforce Specialist, CompTia A+

SKILLS

- **Languages:** Java/Kotlin • JavaScript • C# • Typescript • SQL • Python • HTML & CSS
- **Frameworks/Libraries:** React • Node.js • Express.js • .NET • Next.js • Jest • Tailwind CSS
- **Tools:** Git • Bitbucket • Jira • QMetry • Confluence • Docker • Postman • Figma • Selenium • Puppeteer
- **Database & Cloud:** AWS (DynamoDB, S3, Lambda) • Firebase • PostgreSQL • MySQL • GraphQL

EXPERIENCE

Software Developer / Solutions Analyst

Jan 2025 – Dec 2025

Blackforce Inc. – Remote

- Developed and deployed **10 production features** for BluePass, a broker-facing platform serving **1,900+ brokers nationwide**, using **React, Java, and Gosu** resulting in faster system response times and **~15% improved broker efficiency**.
- **Delivered 2-3 production-ready features and enhancements per sprint**, owning tasks end-to-end from requirements analysis to deployment, and consistently aligning solutions with business goals.
- Worked closely with **4 cross-functional teams** (dev, QA, product, business) to align on requirements, shaping scalable solutions and translating goals into well-defined **Jira** tasks used by a team of over 30 developers and analysts.
- Refactored **~1,200 lines of legacy code** across multiple modules into a reusable **React** component integrated with **Guidewire**, centralizing validation logic to ensure consistent behaviour across the entire BluePass platform. This **improved maintainability, reduced duplication across multiple components, and decreased future validation-related bugs** throughout **over 40 key user workflows** in the application by centralizing updates in one reusable module.
- **Led QA for a sprint's worth of peer developed features** using **QMetry**, manually validating against **Jira** acceptance criteria across **6 lines of business** and ensuring timely promotion through the SDLC.
- Rewrote and expanded unit tests using **Jest** for new features I developed, **increasing test coverage to 90%** by refactoring outdated test logic and adding comprehensive cases. These features were deployed to production and have been used by thousands with zero known bugs to date, strengthening platform reliability and reducing post-release issues.
- **Led the creation of sprint metric reports for a 23-person Agile team**, tracking completion rates, and carryover across sprints. These reports were used in **retrospective** meetings to assess team performance and inform future sprint planning.
- Delivered **multiple polished feature demos to product owners** during biweekly reviews, clearly showcasing enhancements and bug fixes I implemented, and explaining their direct impact on user experience and business goals.

Full-Stack Developer (Co-op)

Apr 2024 – Aug 2024

Ace Project Space – Winnipeg, MB (On-site)

- Designed and contributed to the development of a healthcare web application using **Django (Python) and React**, implementing secure, role-based workflows to support clinical and administrative processes.
- Developed **RESTful APIs** in **Django** to manage user authentication, authorization, and structured data exchange between frontend and backend systems, ensuring secure handling of patient-related information.
- Built responsive React components with dynamic state management, enabling real-time interaction across user roles (e.g., clinicians, administrators) and improving usability of complex healthcare forms and workflows.
- Assisted in integrating a **Python-based predictive analytics** component that leveraged historical system data to support workflow decision-making and enhance operational visibility within the platform.
- Optimized relational database queries using **PostgreSQL/SQL Server**, improving data retrieval efficiency and maintaining data integrity across user activity logs and application modules.
- Participated in **Agile** sprint cycles, presenting progress updates to stakeholders, conducting debugging sessions in staging environments, and documenting architecture, API contracts, and deployment procedures.
- Supported deployment and production monitoring through **DigitalOcean** infrastructure, contributing to system stability and iterative feature releases during the project lifecycle.

- Optimized performance across devices, **reducing load times to under 2 seconds** on core pages via **lazy loading**, **image compression**, and **Firestore tuning**, delivering a fast and smooth user experience on mobile and desktop.
- Implemented a feedback-to-**GitHub** pipeline to streamline issue tracking. User suggestions are reviewed, triaged, and converted into backlog tasks, allowing continuous iteration based on real user needs.
- **Independently built and maintained all core aspects of the platform**, including backend architecture, frontend design, authentication, and deployment, showcasing full-stack capability and ownership.

PROJECTS

QUICKLIST – AI-Powered Product Listing Assistant

Feb 2025 (Built in 48 hours at hackathon)

.Builder's League Hackathon 2025 Top 10 out of 100+ participants, sponsored by **Origatou's**

- Built a full-stack AI-powered web app using **React** and **OpenAI's Computer Vision API** that lets users upload a photo of an item and automatically extracts product name, category, and condition using **image analysis** and **natural language processing**.
- **Integrated a dynamic pricing algorithm** to suggest competitive selling prices based on live market data and item condition, helping users accurately price products for faster sales.
- **Automated multi-platform listings** (e.g., Facebook Marketplace, Kijiji) using **Puppeteer**, **cutting manual entry time by 90%** and enabling one-click publishing.
- Designed a clean, responsive UI that allows users to list items in seconds, turning a traditionally tedious process into a fast, AI-powered experience.
- Placed **Top 10 overall** out of 100+ teams.

AI Knowledge Assistant – Personal AI Knowledge System

Personal Project | 2026

- Built a Retrieval-Augmented Generation (RAG) AI system that allows users to upload documents and ask questions using natural language, returning answers grounded in the user's own knowledge base.
- Developed a modular **.NET Web API backend** that processes documents, generates embeddings, and stores semantic vectors in **PostgreSQL with pgvector** to enable fast similarity search.
- Implemented a document ingestion pipeline that extracts text from files, splits content into optimized chunks, and prepares them for semantic indexing and retrieval.
- Designed a scalable architecture that combines **vector search, embeddings, and LLM responses** to deliver accurate answers based on uploaded content.
- Containerized the application using **Docker** and structured the solution into clean architecture layers (API, Core, Infrastructure) to support maintainability and future ML pipeline integration.

Football Blog CMS – Content Management System

First Year Software Development Project

- Developed a content management system (CMS) for a football blogging platform using **PHP, PostgreSQL, Bootstrap, HTML, CSS, and JavaScript**, allowing users to publish, edit, and manage football-related articles.
- Designed and implemented backend logic in **PHP**, integrating with **PostgreSQL** for structured data storage, relational modeling, and efficient content retrieval.
- Built secure authentication workflows including session management, password hashing, and role-based access for administrators and content contributors.
- Implemented full CRUD functionality for posts, categories, and comments, enabling dynamic content updates and moderation capabilities.
- Designed a responsive frontend using **Bootstrap and JavaScript**, ensuring intuitive navigation, structured article presentation, and clean user interaction.
- Structured the database schema to support scalable content management, category filtering, and user-specific publishing controls.
- Delivered a fully functional CMS capable of managing structured blog content with admin controls and extensible architecture.

E-Commerce Web Application – Full-Stack Development Project

Jan 2024 – Apr 2024

Academic Software development Project

- Built a full-stack e-commerce web application using **Ruby on Rails, HTML, CSS/SCSS, and JavaScript**, implementing MVC architecture and structured separation of concerns across controllers, models, and views.
- Designed relational database schemas to manage products, users, orders, and categories, writing ActiveRecord queries and enforcing data validation rules to maintain data integrity.
- Implemented user authentication and session management, enabling secure account creation, login workflows, and protected routes for order and cart functionality.
- Developed dynamic product browsing and cart features, integrating JavaScript to enhance interactivity and improve user experience through real-time updates.
- Applied RESTful routing principles and modular code organization to support scalable feature expansion and maintainable backend logic.
- Managed the project lifecycle using Git and Agile-style iteration, delivering a fully functional MVP within a 12-week development cycle.
